

Project report

“What to Read”

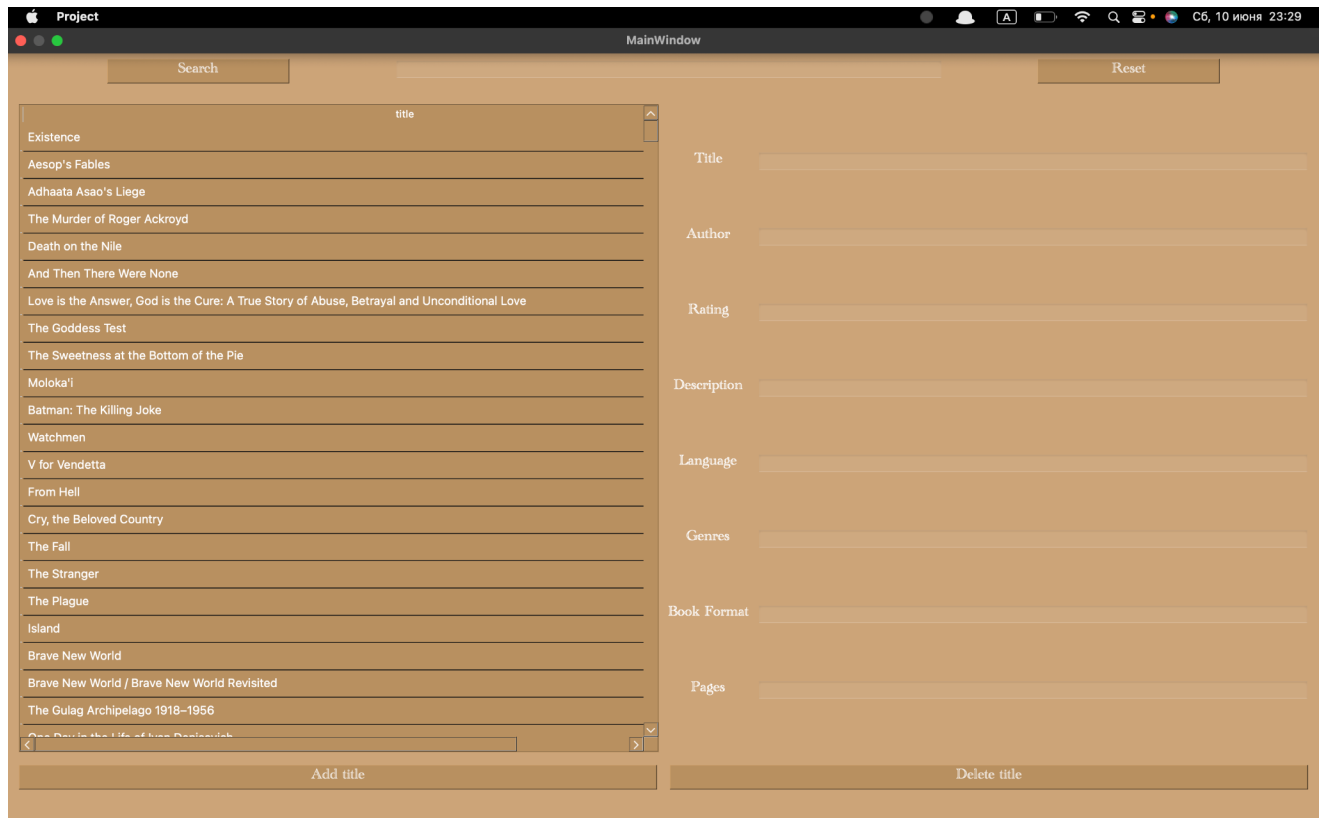

The main goal of my project is to help people to find a book they want to read. I took the dataset from [kaggle.com](https://www.kaggle.com) with popular books. I added some features to my application to make the interface more convenient.

Header and source files of the project:

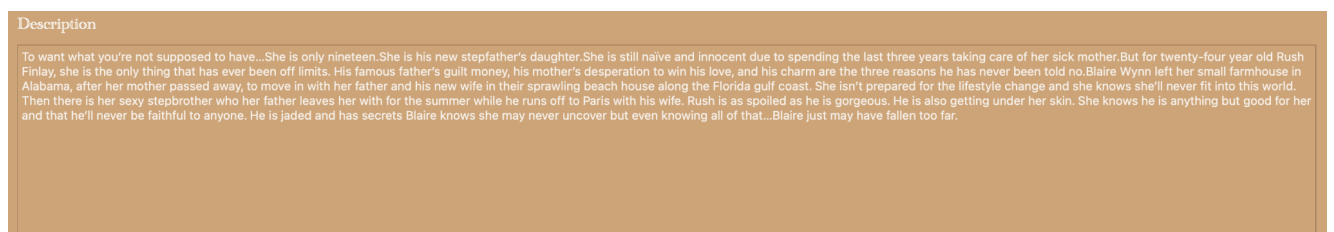

I have 4 classes (windows) in the project, here I want to quickly show them.

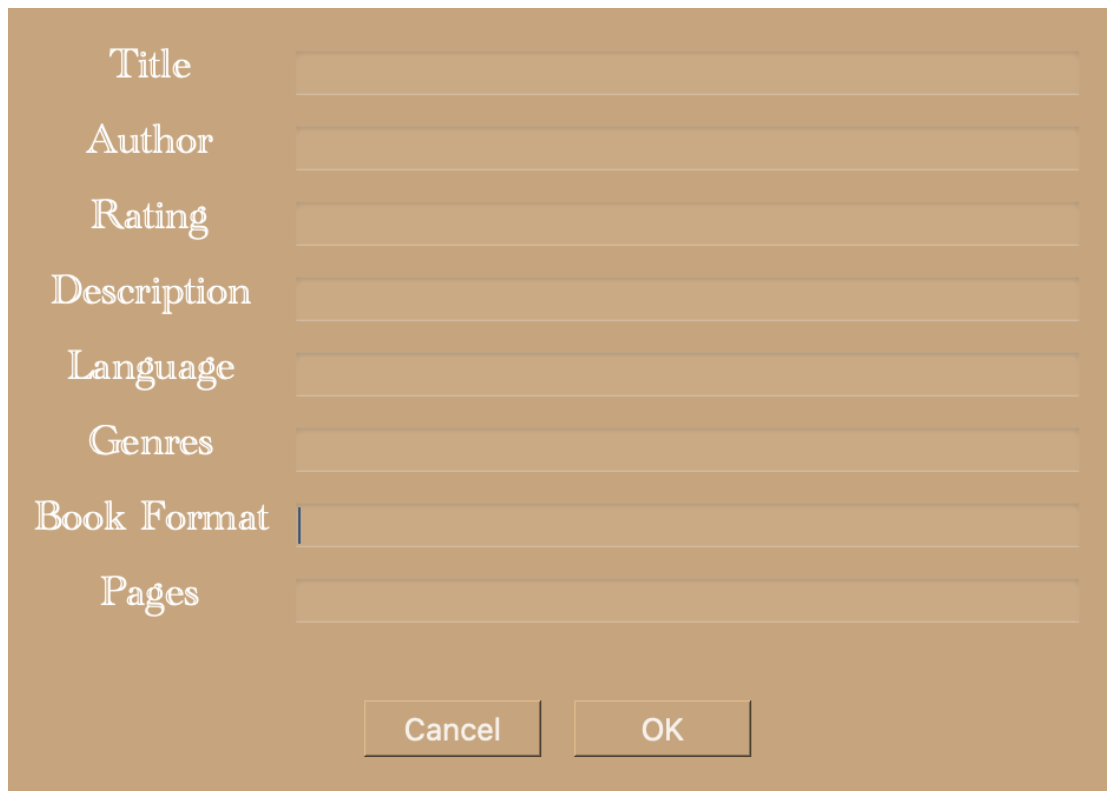

1. MainWindow: This is the most important window of application. Here on the left side you can see a big table with book's titles. By a click on the title you can get detailed information about the book (Author, Rating (0-5), Language etc.). There are some buttons in the main window, they will be described below.

2. Double click on the MainWindow: when you make a double click on any title, there appears a window with a short description of its plot. For example:

3. Add title button: allows you to add a new title with its feature. Also, a new window appears.

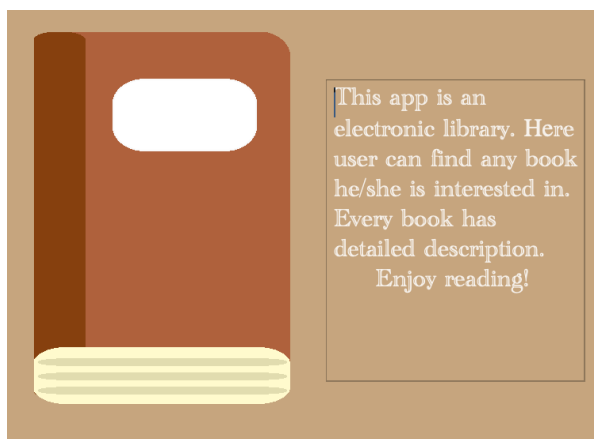

A screenshot of a book entry form. The form has a light brown background. On the left side, there are labels for the input fields: "Title", "Author", "Rating", "Description", "Language", "Genres", "Book Format", and "Pages". Each label is followed by a corresponding input field. The "Book Format" field has a small vertical line on its left side. At the bottom right of the form, there are two buttons: "Cancel" and "OK".

4. Delete title button: allows you to delete title with its features if you want to.

5. Search line and Search button: allows you to find a book by its title (also by a part of a title, for example “adventure” will give you all books about adventures).

6. Reset button: will reset your search and put all titles in alphabetical order (sometimes it can be convenient)

7. Project button: here on the left corner there is a button “Project”. After clicking on it another button “About project appears” and shows the logo of the application.

Conclusion: all these features will help user to find books, add them and read interesting information about any title.
